## Reminder sheet

## Mental method

I Use a mental method if you can and write the answer straight down.

## Written method

2 Write down an estimate of the answer.
3 Set out the division on squared paper using the layout)
4 Label the columns with H T U for numbers up to 999, leaving space for your answer. Use Th for thousands. Miss out the labels if you are confident.

5 Write the digits in the correct columns.
6 Start dividing into the highest place-value (the highest digit is on the left). If the digit is too small, take the first two digits instead.
7 Write your answer in the same column above the $\square$ line.
8 If you have a remainder when you divide, carry the remainder into the next column on the right.
(9 If you have a remainder when you have finished the division, then write it using the letter $\mathbf{r}$.

10 Later, you can write the final remainder as a fraction or decimal instead of using the letter $\mathbf{r}$.

II Compare your answer with your estimate. Does the answer look the right size?
