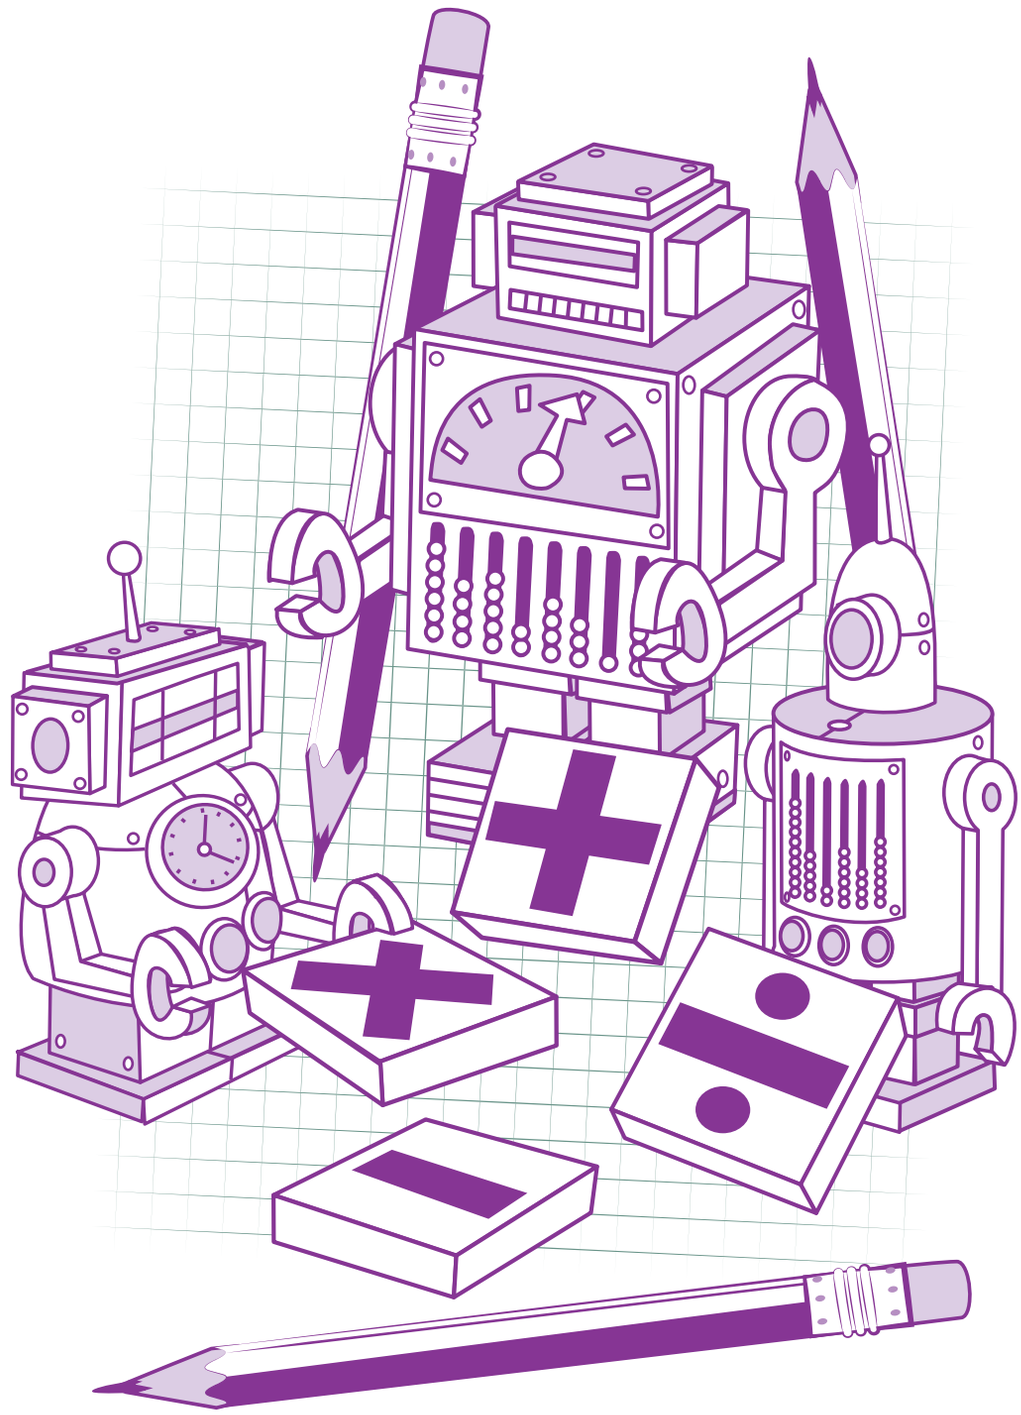
Division 1 Answers



Step 1: Two-digit ÷ one-digit no carrying

Written division is different from other written methods as you work from left to right. It is also different as you end up writing the answer on **top** of the question rather than underneath it!

To divide 69 by 3, set it out like this with space for the answer above.

69 ÷ 3 = ?

	T	U
3)	6	9

What to do

69 ÷ 3 = ?

1. Look at the tens digit of the large number. Here it is 6. Divide this digit by the **divisor** (that is, the number you are dividing by) which is 3 here. Ask: *How many 3s in 6?* Write the answer 2 above the line in the tens column.

	T	U
	2	
3)	6	9

2. Now look at the units digit of the large number. Here it is 9. Divide this digit by the divisor, 3. Ask: *How many 3s in 9?* Write the answer 3 above the line in the units column to complete the answer.

	2	3
3)	6	9

3. Check that the answer on the top looks about right. You can multiply the answer by the divisor to see if it gives the other number. For example, here 23 × 3 is about 20 × 3 which is 60, so the answer 23 seems about right.

69 ÷ 3 = 23

Step 2: Three-digit ÷ one-digit no carrying

Larger numbers can be divided in the same way as in Step 1. Remember to work from left to right and write the answer on **top** of the question.

693 ÷ 3 = ?

	H	T	U
3)	6	9	3

What to do

693 ÷ 3 = ?

1 Start with the hundreds digit of the large number. Here it is 6. Divide this digit by the divisor (that is, the number you are dividing by) which is 3 here. Ask: *How many 3s in 6?* Write the answer 2 above the line in the hundreds column.

3)	6	9	3

3 Now look at the units digit of the large number. Here it is 3. Divide this digit by the divisor, 3. Ask: *How many 3s in 3?* Write the answer 1 above the line in the units column to complete the answer.

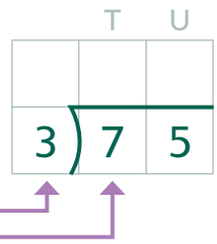
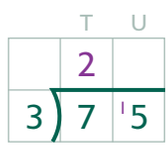
Step 3: Two-digit ÷ one-digit carrying 1 ten

In these questions, the tens digit in the number you are dividing is not a multiple of the divisor (that is, the number you are dividing by). Notice here that the tens digit, 7, is not a multiple of the divisor, 3.

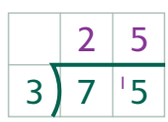


What to do

75 ÷ 3 = ?



1. Look at the tens digit of the large number. Here it is 7. Divide this digit by the divisor, 3. Ask: *How many 3s in 7?* The answer to this question is 2 remainder 1. So write the 2 above the line in the tens column. Carry the 1 ten and write it next to the units digit of the number.



2. Now look in the units column. Instead of 5 units there are now 15 units to divide by 3. Ask: *How many 3s in 15?* Write the answer 5 above the line in the units column to complete the answer.

3. Check that the answer on the top looks about right. You can multiply the answer by the divisor to see if it gives the other number. 25 × 3 = 75. Yes, it does.

75 ÷ 3 = 25

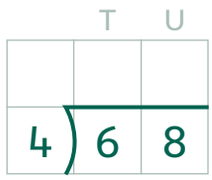
Step 4: Two-digit ÷ one-digit carrying several tens

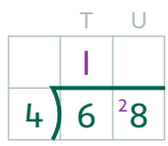
In this step, when you divide the first digit, the number you carry may not be 1. It could be 2, 3, 4 or more.



What to do

68 ÷ 4 = ?

1 Start with the tens digit. Here it is 6. Divide this digit by the divisor, 4. Ask: *How many 4s in 6?* 6 ÷ 4 = 1 remainder 2. So write the answer 1 above the line in the tens column and carry the 2 tens. Write this next to the units digit of the number.



2 Now look in the units column. Instead of 8 units there are now 28 units to divide by 4. Ask: *How many 4s in 28?* Write the answer 7 above the line in the units column to complete the answer.

Step 5: Three-digit ÷ one-digit carrying once

Larger numbers can be divided in the same way. Remember to work from left to right and to carry a digit across where you need to.

A short way to write 'remainder' is 'r'. So, in the calculation below, instead of writing 'remainder 2', we can write 'r2'.

	H	T	U

3	5	^{2}7	6

2 Then look at the tens. Instead of 7 tens, there are now 27 tens. Divide 27 by the divisor, 3. Ask: *How many 3s in 27?* 27 ÷ 3 = 9. Write the answer 9 above the line in the tens column.

3)	9	2	4	6

The questions in this step involve dividing four-digit numbers and carrying once, but you must decide when to carry. Also watch out for when a digit is smaller than the divisor, as you did in Step 8.

What to do

9246 ÷ 3 = ?

1 Divide the thousands digit by the divisor. Ask: *How many 3s in 9?* Write the answer in the thousands column.

	Th	H	T	U
	3			
3)	9	2	4	6

2 Divide the hundreds digit by the divisor. Ask: *How many 3s in 2?* As there are **no** 3s in 2, write 0 above it and write the carried 2 next to the tens digit.

	3	0		
3)	9	2	$^{2}4$	6

3 Then look at the tens. Instead of 4 we now have 24. Ask: *How many 3s in 24?* 24 ÷ 3 = 8. Write the 8 above the line.

	3	0	8	
3)	9	2	$^{2}4$	6

4 Finally divide the units digit by the divisor. 6 ÷ 3 = 2. Write the 2 above the line to complete the answer.

Step 12: Three- or four-digit ÷ one-digit answers with remainders

So far all the divisions have resulted in whole number answers. But, if the large number is not a multiple of the divisor, the answer will **not** be a whole number. Here the answers have **remainders (r)**.

What to do

786 ÷ 5 = ?

1 As usual, working from the left, divide each digit by the divisor. For the hundreds digit ask: *How many 5s in 7?* 7 ÷ 5 = 1 r2. Write the 1 above and carry the 2.

Step 14: Four-digit ÷ one-digit with fraction remainders

Sometimes when we divide, giving an answer with a remainder doesn't make sense. For example, *Pour 3685ml of water into three jars so that there is the same in each jar.* Having some water left over isn't an option. So your answer can't have a remainder.

3685ml ÷ 3

What to do

3685 ÷ 3 = ?

	Th	H	T	U	
	1	2	2	8	r1
3	3	6	8	$^{2}5$	

	1	2	2	8	$\frac{1}{3}$
3	3	6	8	$^{2}5$	

1 Divide as before and work out what the remainder will be. Here 3685 ÷ 3 = 1228 r1.

2 We can't give the answer with a remainder of 1. Dividing the remainder 1 by the divisor 3 gives you the fraction $\frac{1}{3}$ or one-third.

3 Notice that the numerator of the fraction (the number on top) is the remainder and the denominator (the number on the bottom) is the divisor.

3685ml ÷ 3 = $1228\frac{1}{3}$

Step 15: Four-digit ÷ one-digit with remainders as decimals, 1 dp

Sometimes it is more appropriate to give the remainder in an answer as a **decimal**. Using the same method of division, it is easy to find decimal answers. We use a decimal point and extra zero digits. Remember that 7324 is the same as 7324.0 (it just has a zero after the decimal point).

What to do

7324 ÷ 8 = ?

1 As usual, divide each digit by the divisor.

	Th	H	T	U	
	0	9	1	5	
8)	7	$^{7}3$	$^{1}2$	$^{4}4$	

2 When you reach the end and would normally write the remainder, first put a decimal point at the end of the number and also above it in the answer. Next put a zero digit to the right of the number.

	0	9	1	5	.
8)	7	$^{7}3$	$^{1}2$	$^{4}4$	. 0

3 Then carry over the remainder. Here it is 4. Divide the digits after the decimal point by the divisor in the usual way. Ask: *How many 8s in 40?* Write the answer 5 above the line to complete the answer.

	0	9	1	5	. 5
8)	7	$^{7}3$	$^{1}2$	$^{4}4$	. $^{4}0$

7324 ÷ 8 = 915.5

Now you try

Give the remainder for each answer as a decimal.

Step 16: Four-digit ÷ one-digit with remainders as decimals, 2 or 3 dp

Here the answers will have 2 or 3 decimal places. Remember that 1146 is the same as 1146.00 or 1146.000. You can keep writing zeros after the decimal point without changing the number!

What to do

1146 ÷ 8 = ?

1 As usual, divide each digit by the divisor.

	Th	H	T	U		
		0	1	4	3	
8	1	1	3 4	2 6		

2 When you reach the end and would normally write a remainder, first put a decimal point at the end of the number and also above it in the answer. Then put two zeros to the right of the number.

		0	1	4	3 .	
8	1	1	3 4	2 6 . 0	0	

3 Now carry over the remainder. Here it is 2. Divide the digits after the decimal point by the divisor in the usual way, carrying as necessary. Ask: *How many 8s in 20?* Write 2 above and carry 4.

4 Finally divide 40 by 8 and write 5 above to complete the answer.

		0	1	4	3 . 2	5
8	1	1	3 4	2 6 . 2 0	4 0	

1146 ÷ 8 = 143.25

Step 17: Three-digit ÷ one-digit with remainders as recurring decimals

Not every remainder can be written as a decimal with one, two or three digits after the decimal point. Some decimals keep on going forever. They are called **recurring decimals**. You'll see why this happens in this example.

What to do

473 ÷ 3 = ?

1 Divide each digit by the divisor.

2 When you reach the end and would normally write a remainder, put a decimal point at the end of the number and also above it in the answer. Put zeros to the right of the number.

3 Now carry over the remainder. Here it is 2. Divide the digits after the decimal point by the divisor in the usual way, carrying as necessary. Ask: *How many 3s in 20?* Write 6 above and carry 2.

4 Keep going, but each time you will see that we write 6 above and carry the 2. You could keep going forever! This is a recurring decimal. We write a dot over the last digit to show that it is recurring.

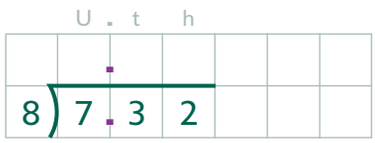
Step 18: Dividing decimals by one-digit numbers

Now that you know how to divide whole numbers by one-digit numbers you can divide decimals in the same way. Just follow the same method and make sure you put the decimal point in the correct place in the answer.

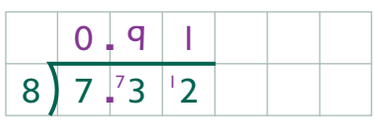
What to do

7.32 ÷ 8 = ?

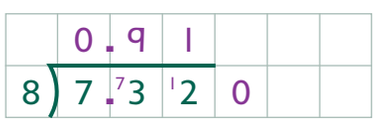
1 Write a decimal point in the answer directly above the decimal point in the number.



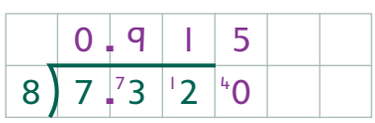
2 As usual, divide each digit by the divisor.



3 If necessary, write zeros at the end of the number to help you complete the answer. You can do this because 7.32 is the same as 7.320 or 7.3200.



4 Now carry over the remainder. Here it is 4. Divide 40 by 8 to complete the answer.



7.32 ÷ 8 = 0.915
